

Explore IceWarp Version 11.3

With the world's first integration of LibreOffice Online

- WebDocuments allow users to read Office files directly in WebClient, browse through the documents, see all edits and use online full-text search
- WebAdmin includes a real-time Dashboard displaying the current traffic and service statuses
- WebClient has been refreshed to a modern appearance including all icons and fonts

WebClient

WebDocuments

The world's first integration of LibreOffice Online brings high-fidelity document rendering to WebClient. Users can preview Excel sheets, play PowerPoint presentations and view Word and all ODF files directly in the browser, without having to install any Office suite on their computers.

Documents Direct Preview

Office documents are previewed in the reading pane immediately when clicked. Clicking inside the document allows to see any edits, search, zoom and open it in a separate window to multitask with emails, files and online meetings.

Auto-Hiding Folders

The folder tree on the left is automatically minimized to make room for content.

The adjustment is automatic on low-resolution displays or when the WebClient window is resized to smaller width. Users can set both left and right panels to be always expanded or always collapsed.

Auto-Hiding IM Contacts

The IM contact list on the right is minimized to make room for content, but users can still see contact photos, online statuses and hover over the contact to restore full size.

Refreshed Design

The icons and interface fonts have been updated to a modern, lightweight appearance.

Windows 10 Touch Support

The desktop interface is enabled for touch input on Windows computers with a touch screen. This includes actions such as scrolling, touching to reveal delete, flag controls, or collapsing the side panels.

Multi-Line Preview of Contacts, Tasks, Notes, Files

All types of folders now offer the multi-line preview that was initially available for emails. For example in contacts, users can immediately see all email addresses, phone numbers and photos right in the contact list.

Meeting Invitations

In addition to Accept and Decline replies to an invitation, attendees can now provide a Tentative response, provide a reason when declining, and Propose a new time for a meeting invitation right from the invitation email.

Zoom to Events in Month View

Users can quickly zoom into the detailed agenda for a particular day in month view by clicking the small calendar icon next to the date label. The preview is active so it's possible to move the events, create new appointments and so on.

Other Sent & Trash Folders

Other accounts can have their own Sent folder, as well as separate Trash folder to restore deleted items back to the account's mailbox. Users only need to map these folders in Other Account options.

Delete Folders to Trash

When deleting one of the primary account's folders, it is now moved to trash including any subfolders. This feature prevents accidental deletion because whole folders can be restored by a single click including their contents.

Delete Button in Properties

There is now a Delete button in item properties that allows you to delete an unwanted item right when looking at it.

Auto Save Contacts, Calendars

Similar to email drafts, when adding new groupware items such as contacts, calendars, notes, the item is saved every few minutes without having to click OK. When editing existing items, the Cancel button wouldn't restore the original item.

Visual Clue for Event Type

Events in the calendar have a visual indication to distinguish between busy, free and tentative event status.

Active Speakers in Meetings

See who's currently talking in an online meeting to detect echo or noise on the side of one attendee. The active speaker has a highlighted background in attendee list.

WebAdmin

Dashboard

Dashboard is the administrator’s control center designed for the big screen. It joins two most important views into a single screen: Service Status, which includes run-time statistics, and Current Traffic, which provides invaluable insight to the server activity in real-time, through an animated chart of server connections and processed data volumes.

What are you looking for? ✕

NAME	TYPE	VALUE	DESCRIPTION
DOMAIN			
d_accountnumber	Integer	0	Domain Admin account limit
d_adminemail	String	Enter value	Administrator's email
d_description	String	Documenting domain	Domain description
d_disablelogin	Boolean	<input type="checkbox"/> FALSE	Disable login to this domain
d_diskquota	Integer	0	Domain disk quota (kB)

API Console

API console provides low-level access to thousands of server settings, including those not available in the Administration GUI. To get around the immense configuration possibilities, the variables are divided into areas such as Accounts, Domains, Mail, etc., and can be easily searched across the variable name and its detailed description. The dialog is context sensitive, so when looking at global/domain/user WebAdmin options, it will display API options available on that level.

Server Rules

This version implements a complete builder for creating rules, which automatically process incoming email based on defined conditions. When used with Regular Expressions and other special filters, the rules are an indispensable tool to automate email flow within the organization.

Domain Settings

Administrators can now create and manage whole domains, including the most common tasks of viewing and changing disk quota, limiting the amount of messages sent per day, enabling and disabling access to services, remote provisioning and more.

Server

Redesigned Events Report

Server-generated notification emails for daily events, document changes and shared folders access now use a new, rich text template, so that the notifications have a unified look across WebClient and other email clients.

Dual-Layer Anti-Virus

New cloud engine powered by KSN - Kaspersky Security Network - provides online scanning of files using their hashed values that are compared to a global database in real-time. The extra security layer helps to detect aggressive zero-day viruses and together with dual-layer antispam provides a highly effective and comprehensive malware protection.

Outlook Sync

Login Provisions

Line security, login port, login method have been added to provisions, which allows the administrator for example to update all existing installations currently using PLAIN to use the secure STARTTLS authentication.

Notification Center

The progress window now logs all details about the ongoing synchronization so that the user can review all activity about changed, downloaded and uploaded items.
